

iPhone/iPad for Low Vision

Beginning Zoom Gestures

Did you know that Zoom gestures make it easy to see what's on your Apple device screen?

Zoom is built-in magnification software that allows you to magnify and enlarge anything on your screen. **Try it out!**

Turning Zoom On

1. Tap the **Setting** app on your device home screen.
2. Tap **Accessibility** in the **Settings** list to see your accessibility options list.
3. **Zoom** is the second item in the list. Tap **Zoom** to open its settings.
4. The **Zoom** feature is currently turned off. Tap the toggle button to turn it on. Your screen is now magnified.

Beginning Zoom Gestures

Zoom In/Out

5. Double-tap the screen using three fingers. Since your screen was already magnified, this gesture will zoom out.

Tip: Be sure to leave a little space between each finger. Otherwise, your device will see your three fingers as just one big finger and you won't get the correct result from the gesture.

6. Tap twice again with three fingers to zoom back in.

Move Around the Screen

7. Use three fingers, with spaces in between, to drag across the screen. This lets you drag other parts of the screen into view.

Change the Zoom

8. Double-tap on the screen with three fingers. After the second tap, hold your fingers down on the screen.
9. Drag or slide your fingers up the screen to enlarge the text.

9. Slide your fingers up the screen to enlarge the text.
10. Slide your fingers down to decrease the magnification.
11. When the text is a size that works for you, lift your fingers from the screen. This size is now set as your default magnification.

Now you know how to use beginning zoom gestures. Check out the other workshops in this series to learn more about customizing your iPhone or iPad for low vision.
